# In-ground Coal Mercury

average ~ 11 lbs Hg/ $10^{12}$ Btu

# Produced Coal Mercury

average 7.3 lbs Hg/10<sup>12</sup>Btu

**lbs Mercury  
per trillion Btu**

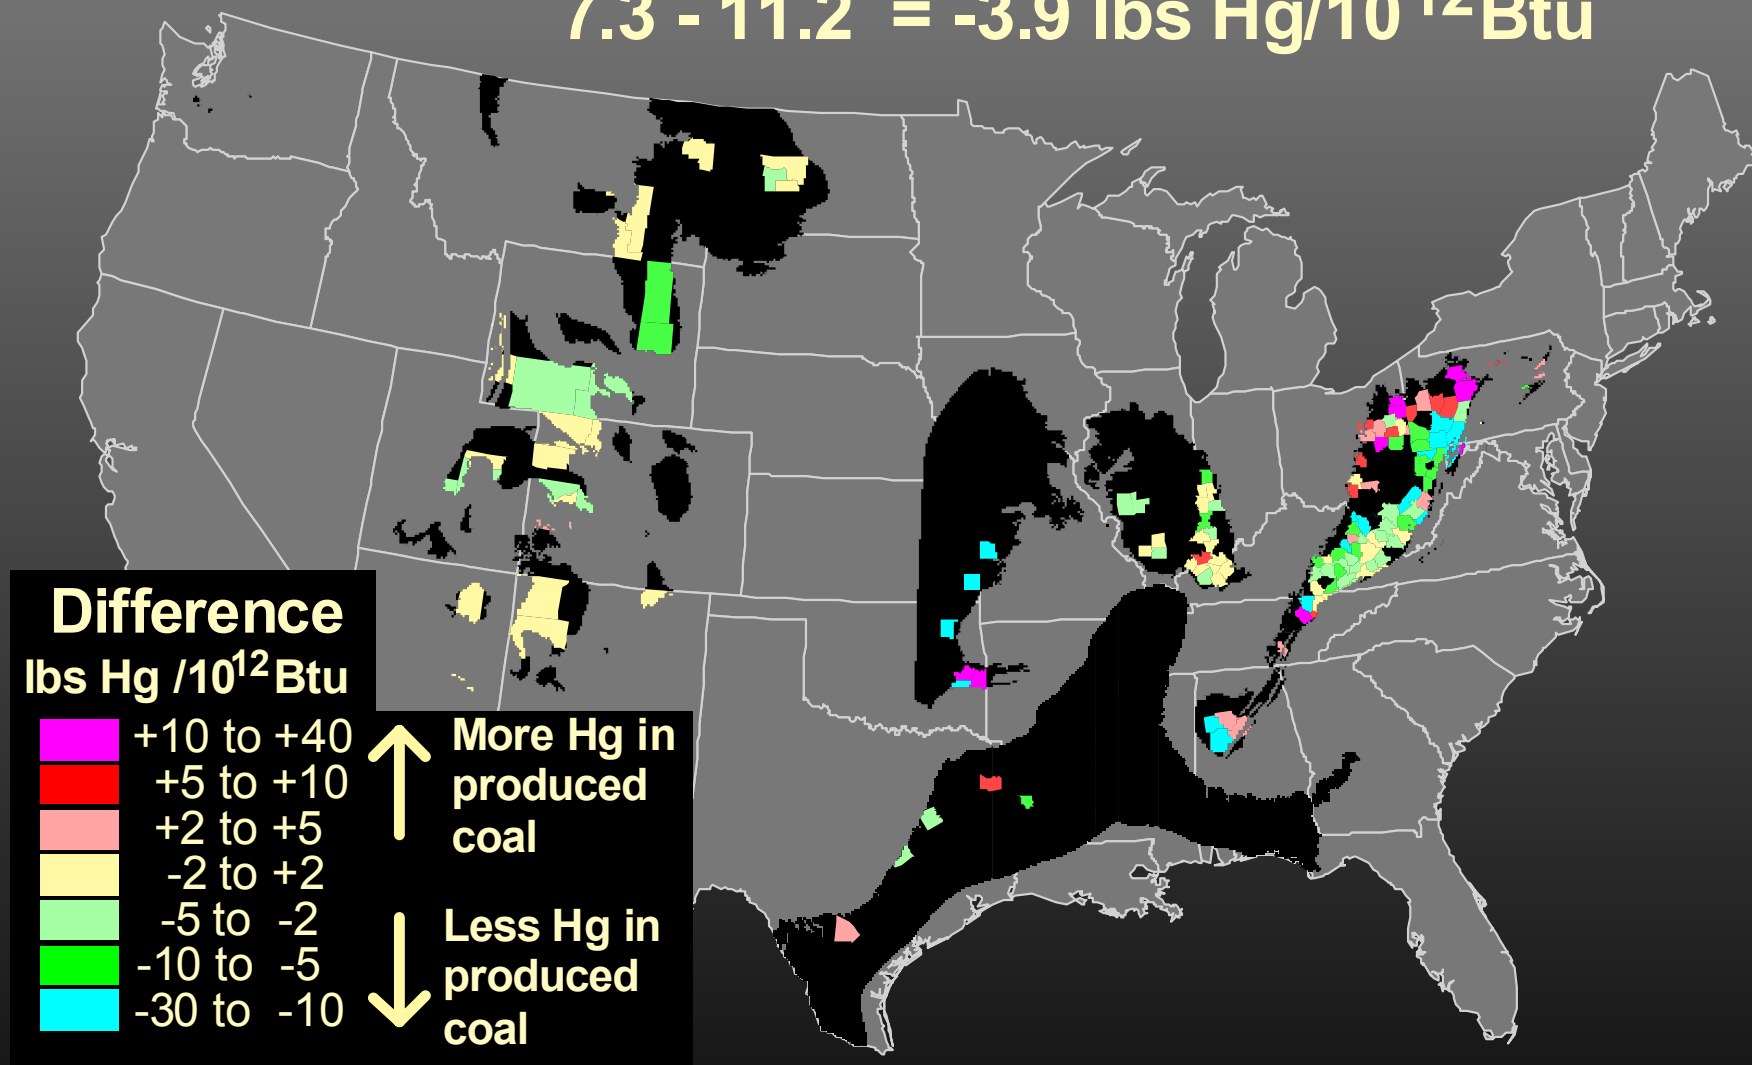

ICR 2 Hg data,  
FERC 423 and MSHA  
production data for  
tonnage-weighted  
average Hg calculation.

# Produced minus In-ground Coal Mercury

$$7.3 - 11.2 = -3.9 \text{ lbs Hg}/10^{12} \text{ Btu}$$

COALQUAL and ICR Hg data for coincident counties, FERC 423 and MSHA production data for tonnage-weighted average Hg.

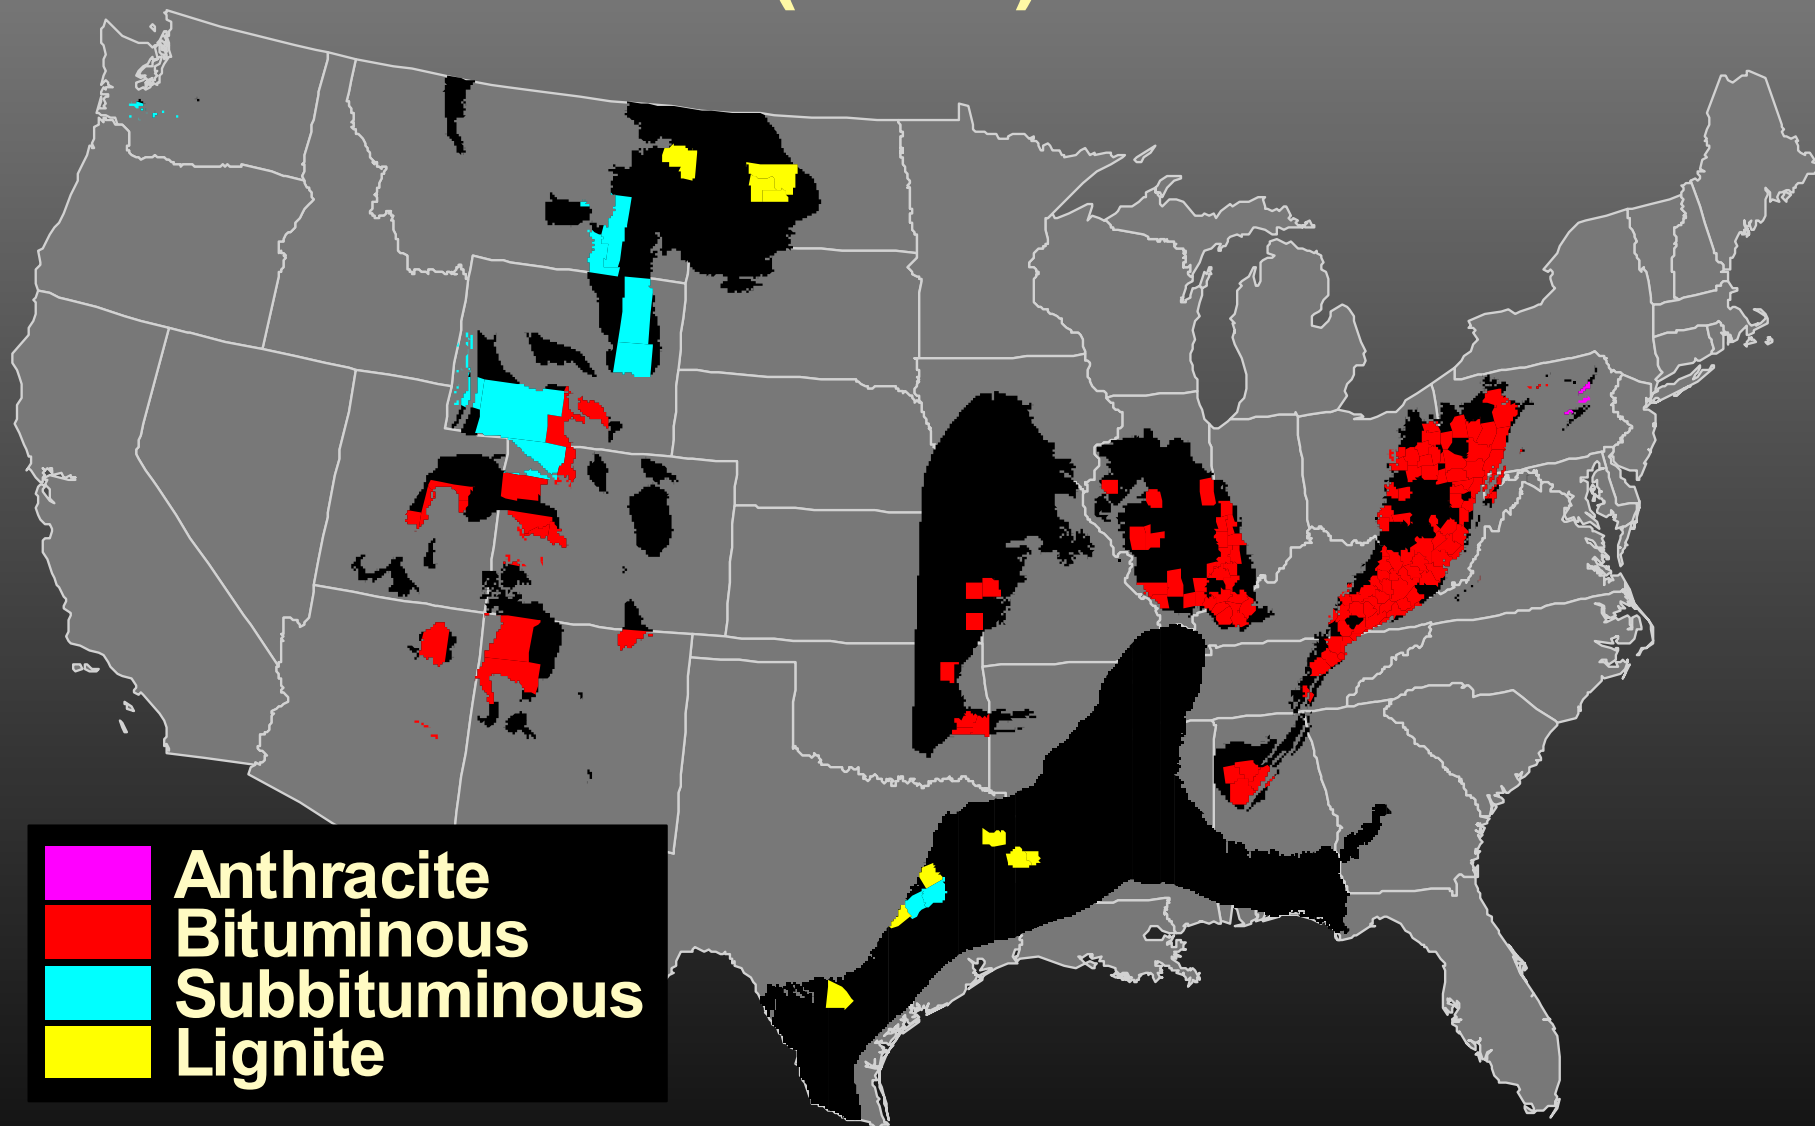

# 2004 Proposed Mercury Rule

## MACT option, existing units

	lbs Hg per trillion BTU		$10^{-6}$ lbs Hg per MWH
bituminous	2.0	or	21
subbituminous	5.8	or	61
lignite	9.2	or	98
IGCC	19	or	200
refuse	0.38	or	4.1

# ASTM (1990) Coal Rank

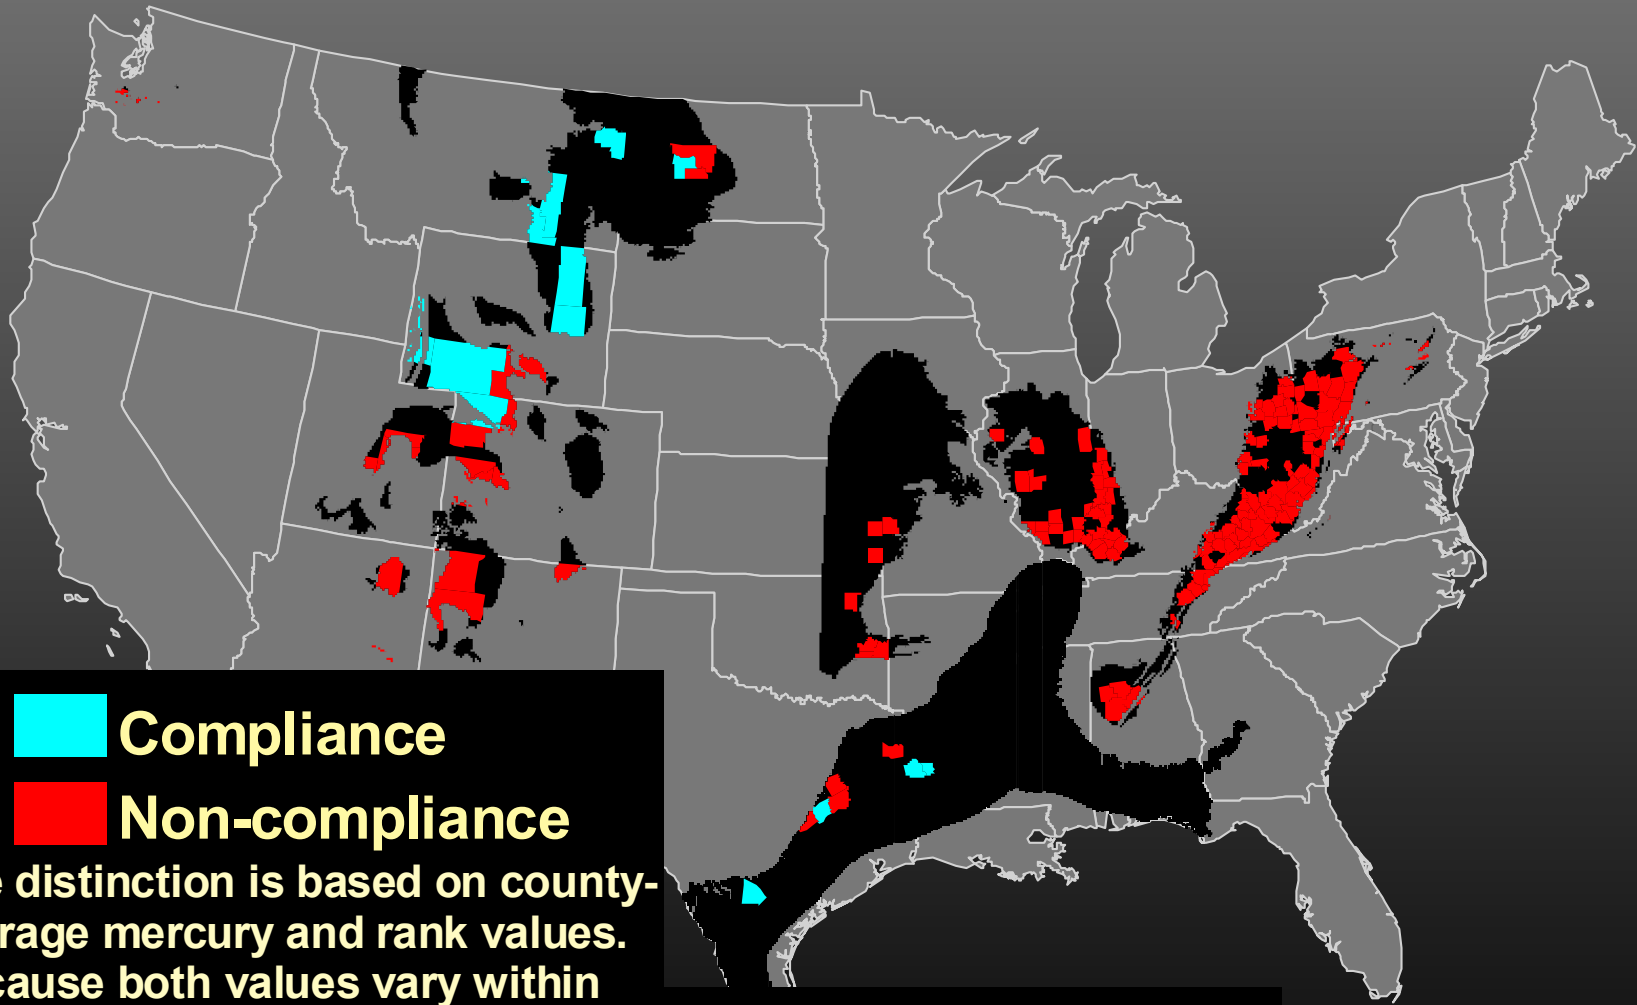

**ICR 2 county averages calculated using data from: FERC 423, FERC 580, and ICR 2 (with estimated moisture)**

# Mercury Compliance Coal existing PC units, MACT rule, no Hg capture

**Compliance**  
**Non-compliance**

The distinction is based on county-average mercury and rank values. Because both values vary within counties, the map is indicative, rather than diagnostic, of Hg compliance coal. County-average Hg from ICR2; rank class from FERC-423, -580, and ICR 2 (moisture estimated).

# Electric Utility Data

# Which equation is best?

# Average Mercury Capture Existing Controls, 162 U.S. Counties

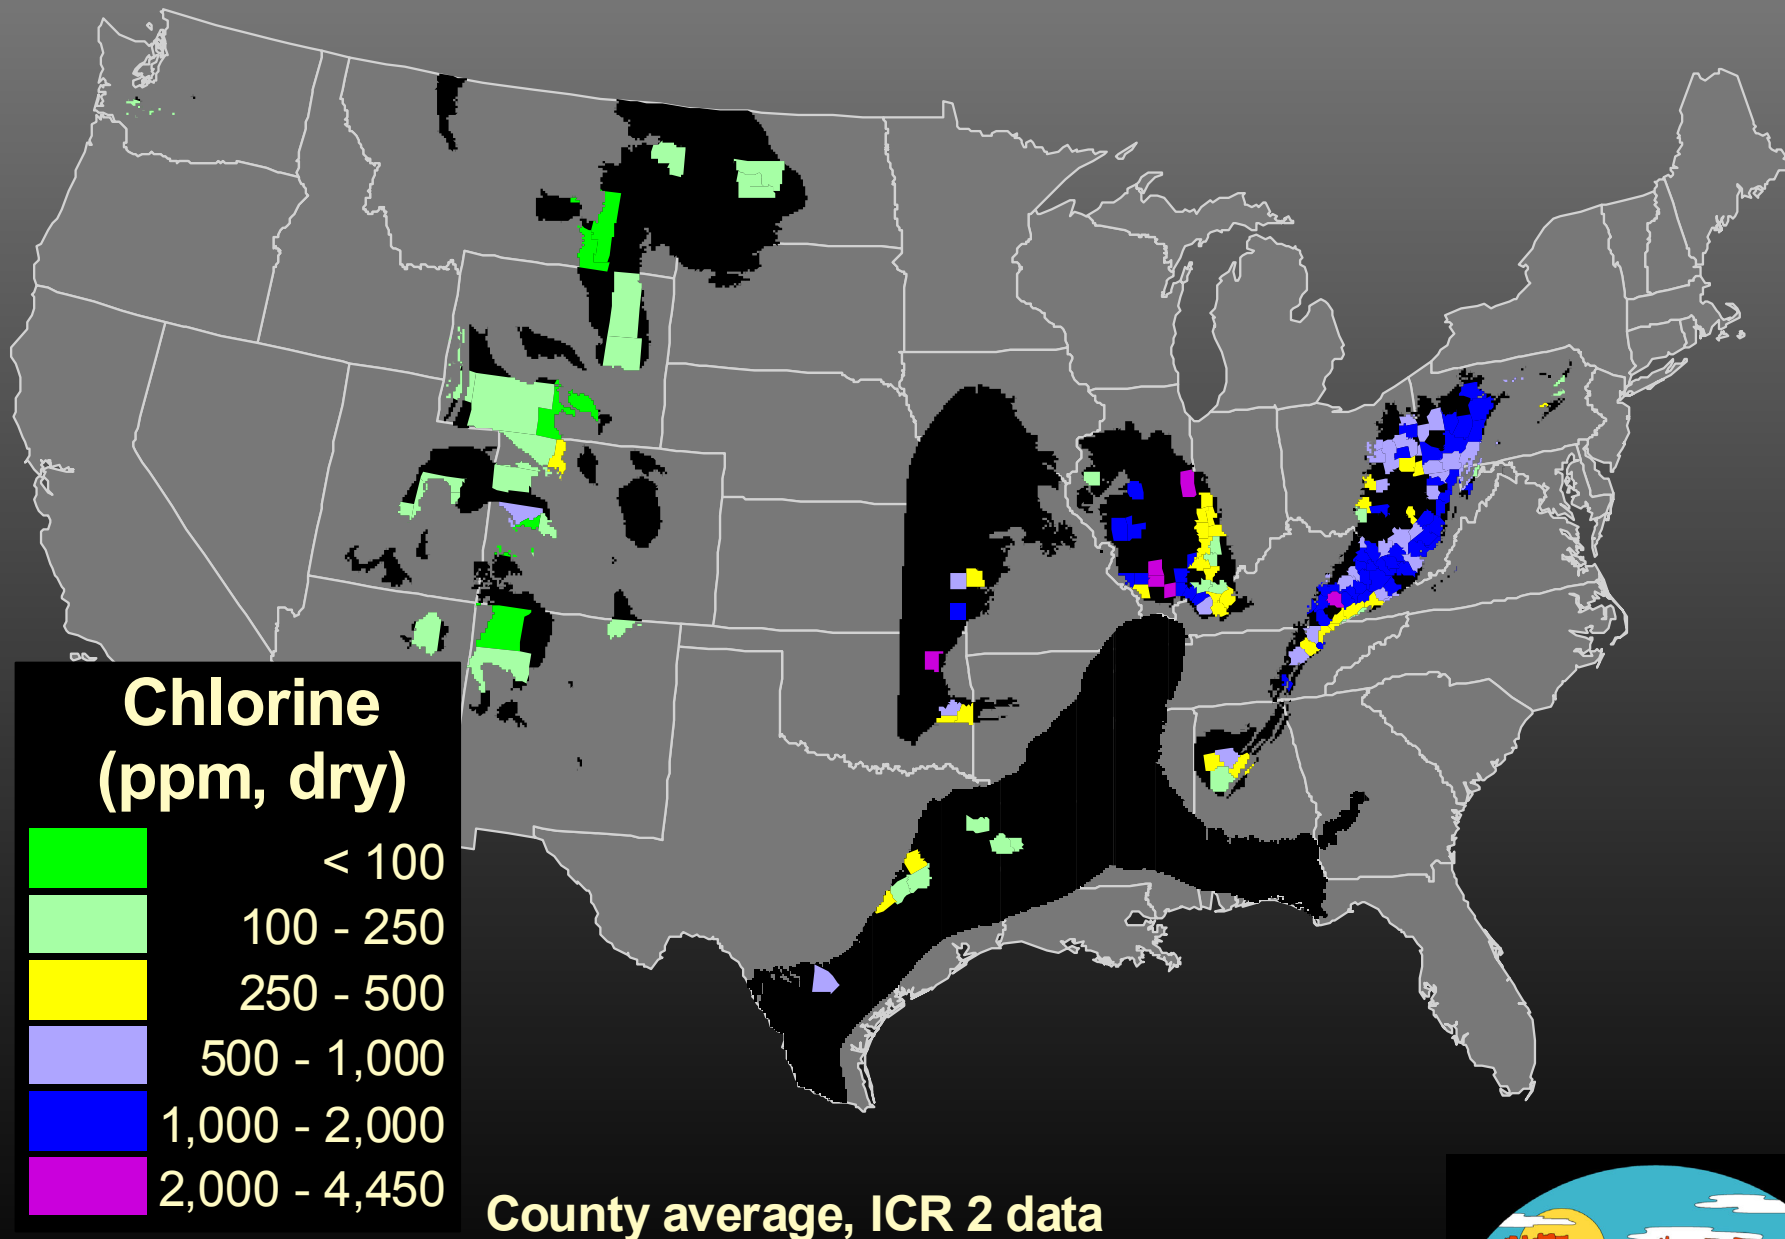

Mercury capture is the average result from three published equations for each emission control group (ICR 3 data, conventional pulverized coal units).

Points correspond to average coal quality, 162 U.S. counties (ICR 2 data).

Not shown are 6 U.S. counties where chlorine exceeds 2,000

# Chlorine in Coal

# Declining mercury capture with increasing coal sulfur

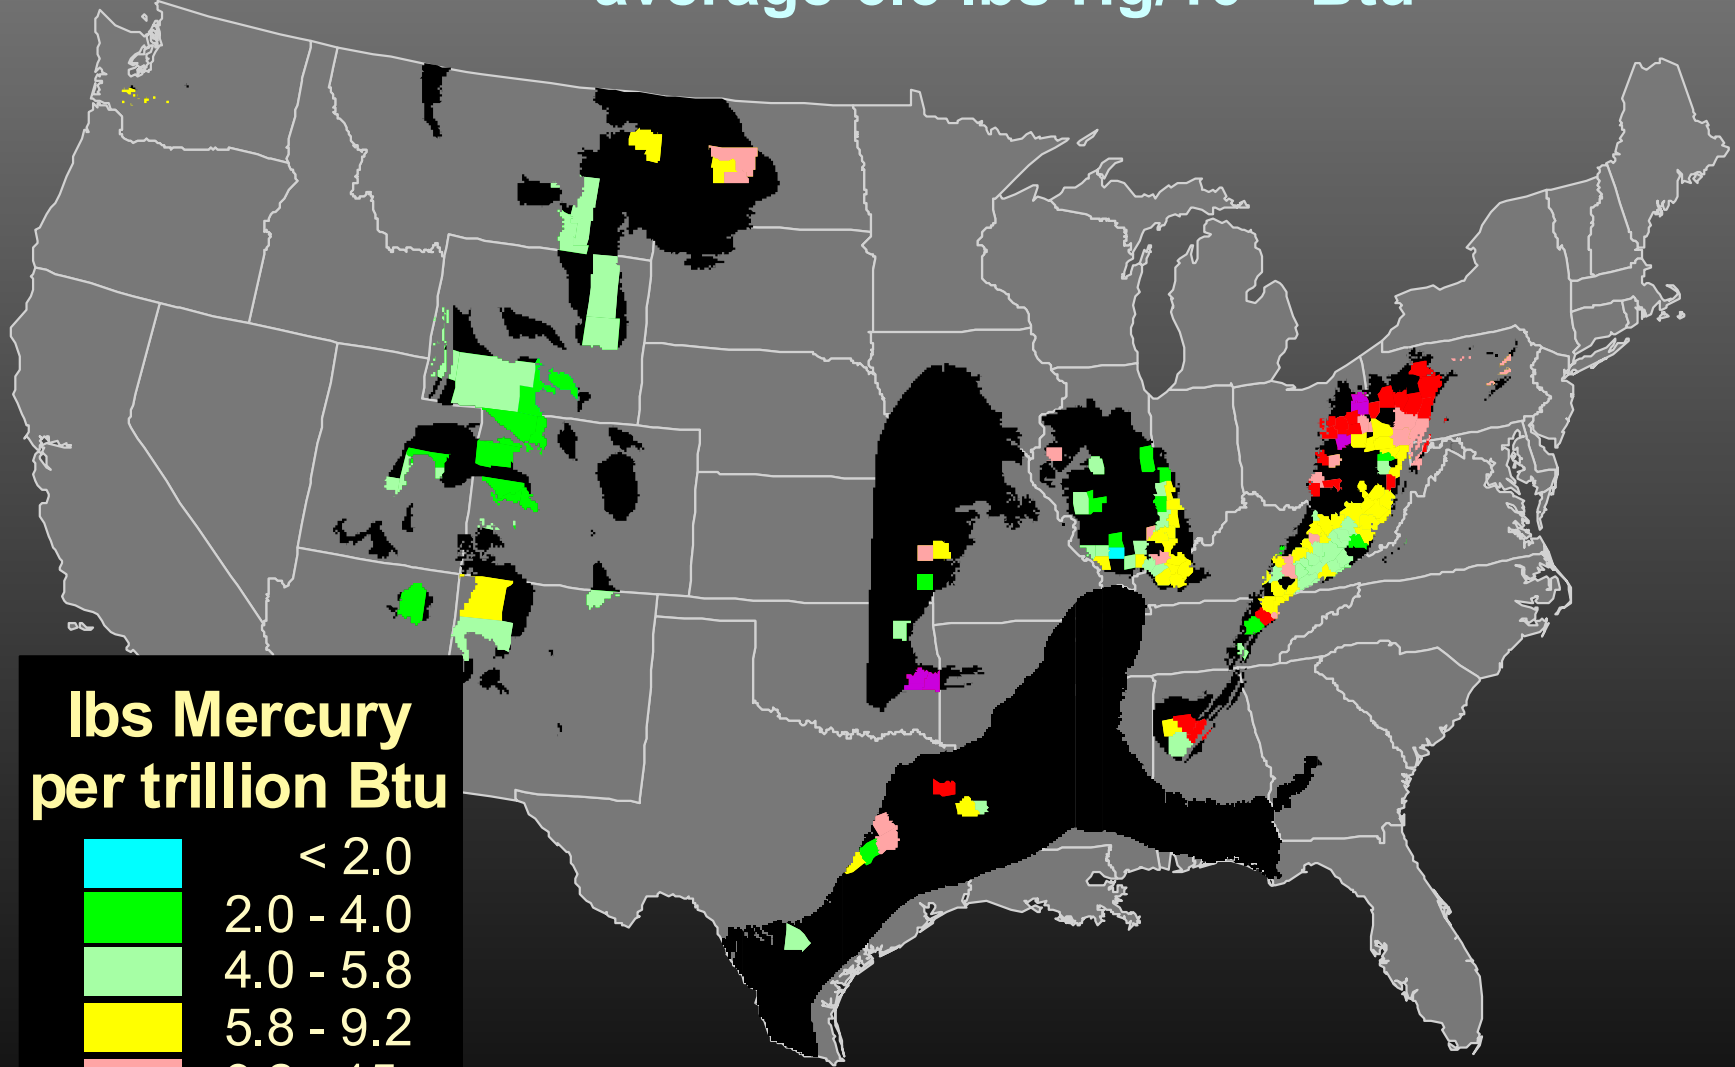

Preliminary CEA data,  
2 cold ESP units,  
Points show weekly  
average values  
+5% carbon in fly ash  
(average 11%)

\* Capture estimated after Meij et al., (2002, J. Air & Waste Manage. Assoc., v.52, p. 912-917) assuming 80% FA, 20% BA fractionation.

# hot ESP Hg emissions, by coal origin

average 6.6 lbs Hg/10<sup>12</sup> Btu

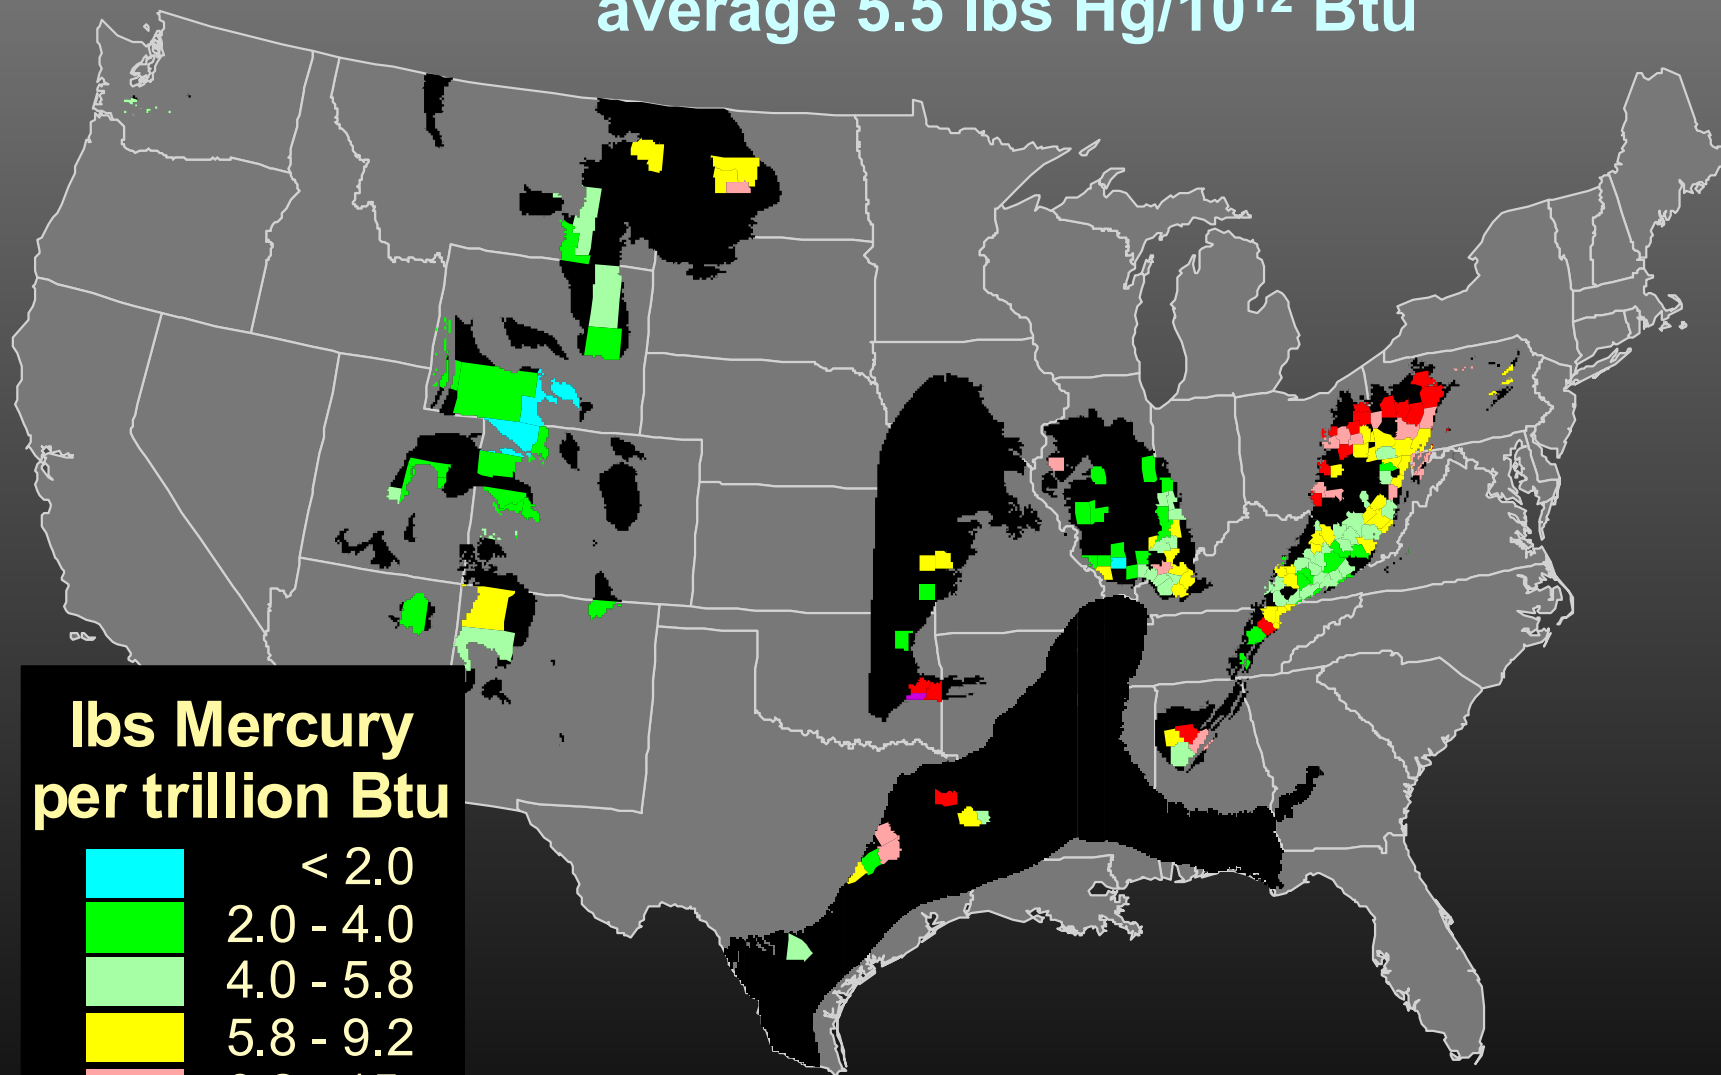

**lbs Mercury  
per trillion Btu**

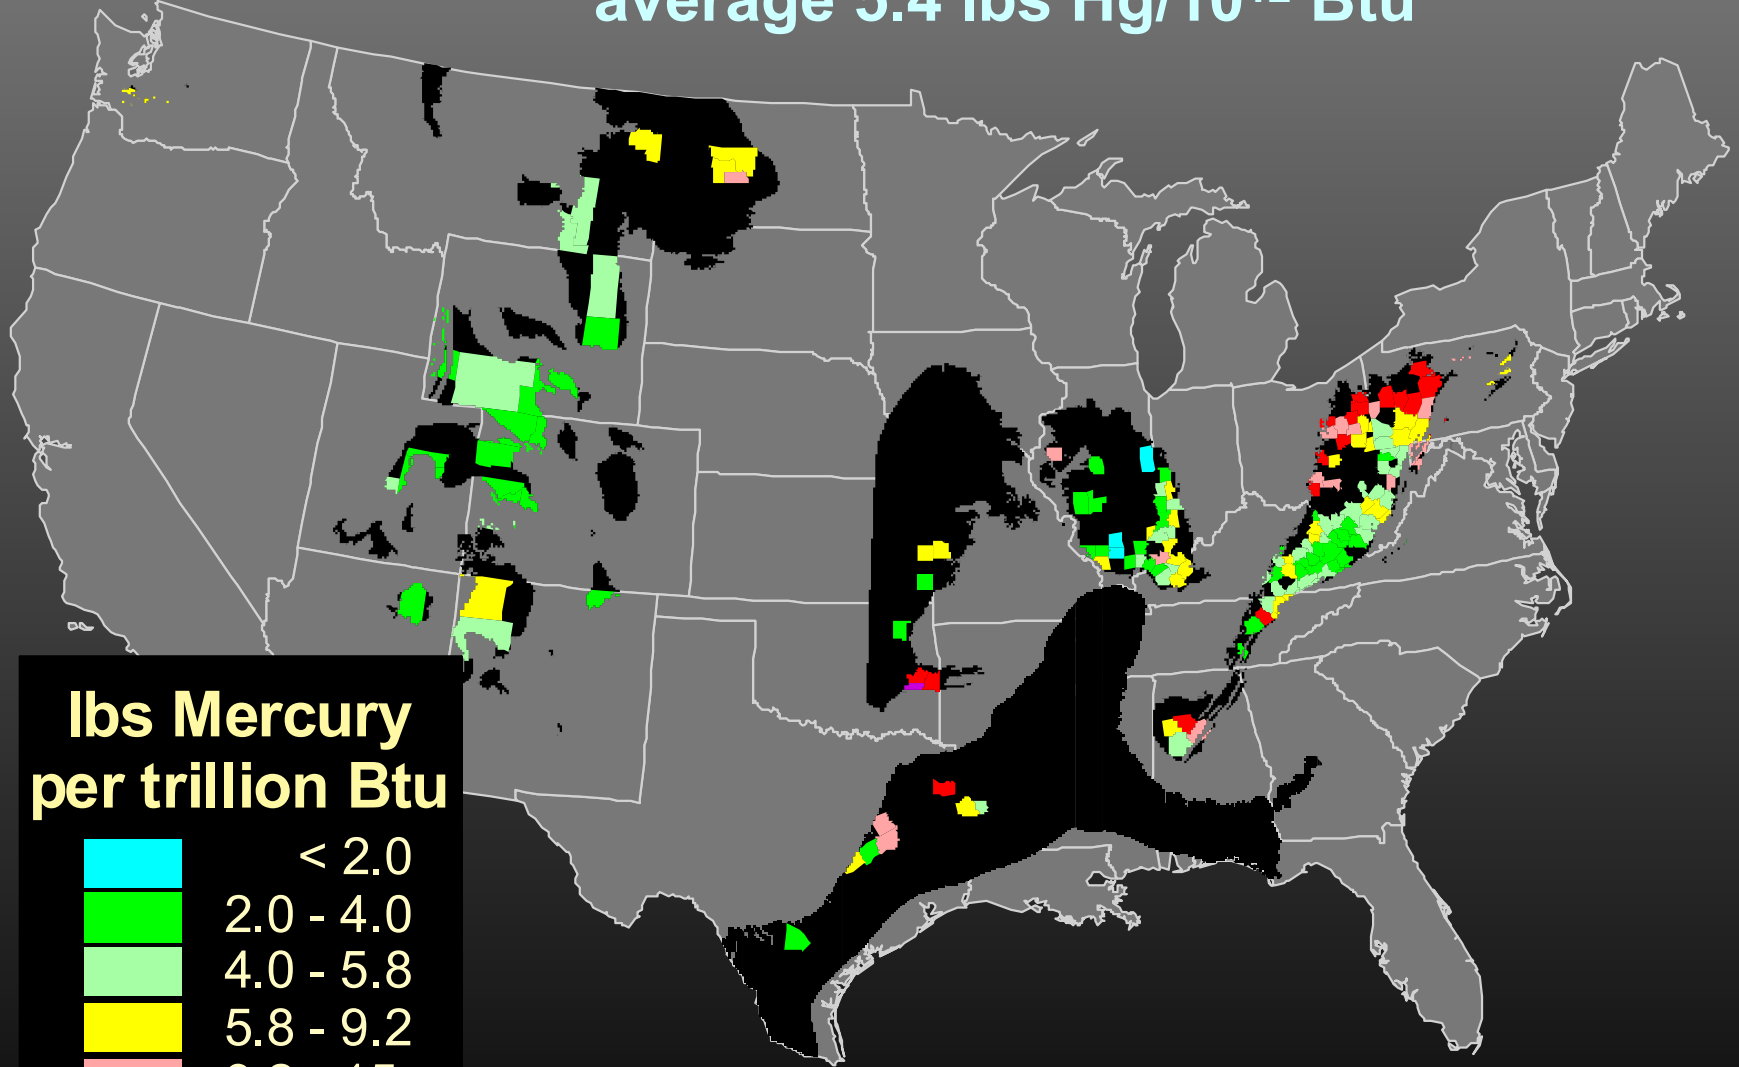

# cold ESP Hg emissions, by coal origin

average 5.5 lbs Hg/ $10^{12}$  Btu

# hot ESP/FGD Hg emissions, by coal origin

average 5.4 lbs Hg/ $10^{12}$  Btu

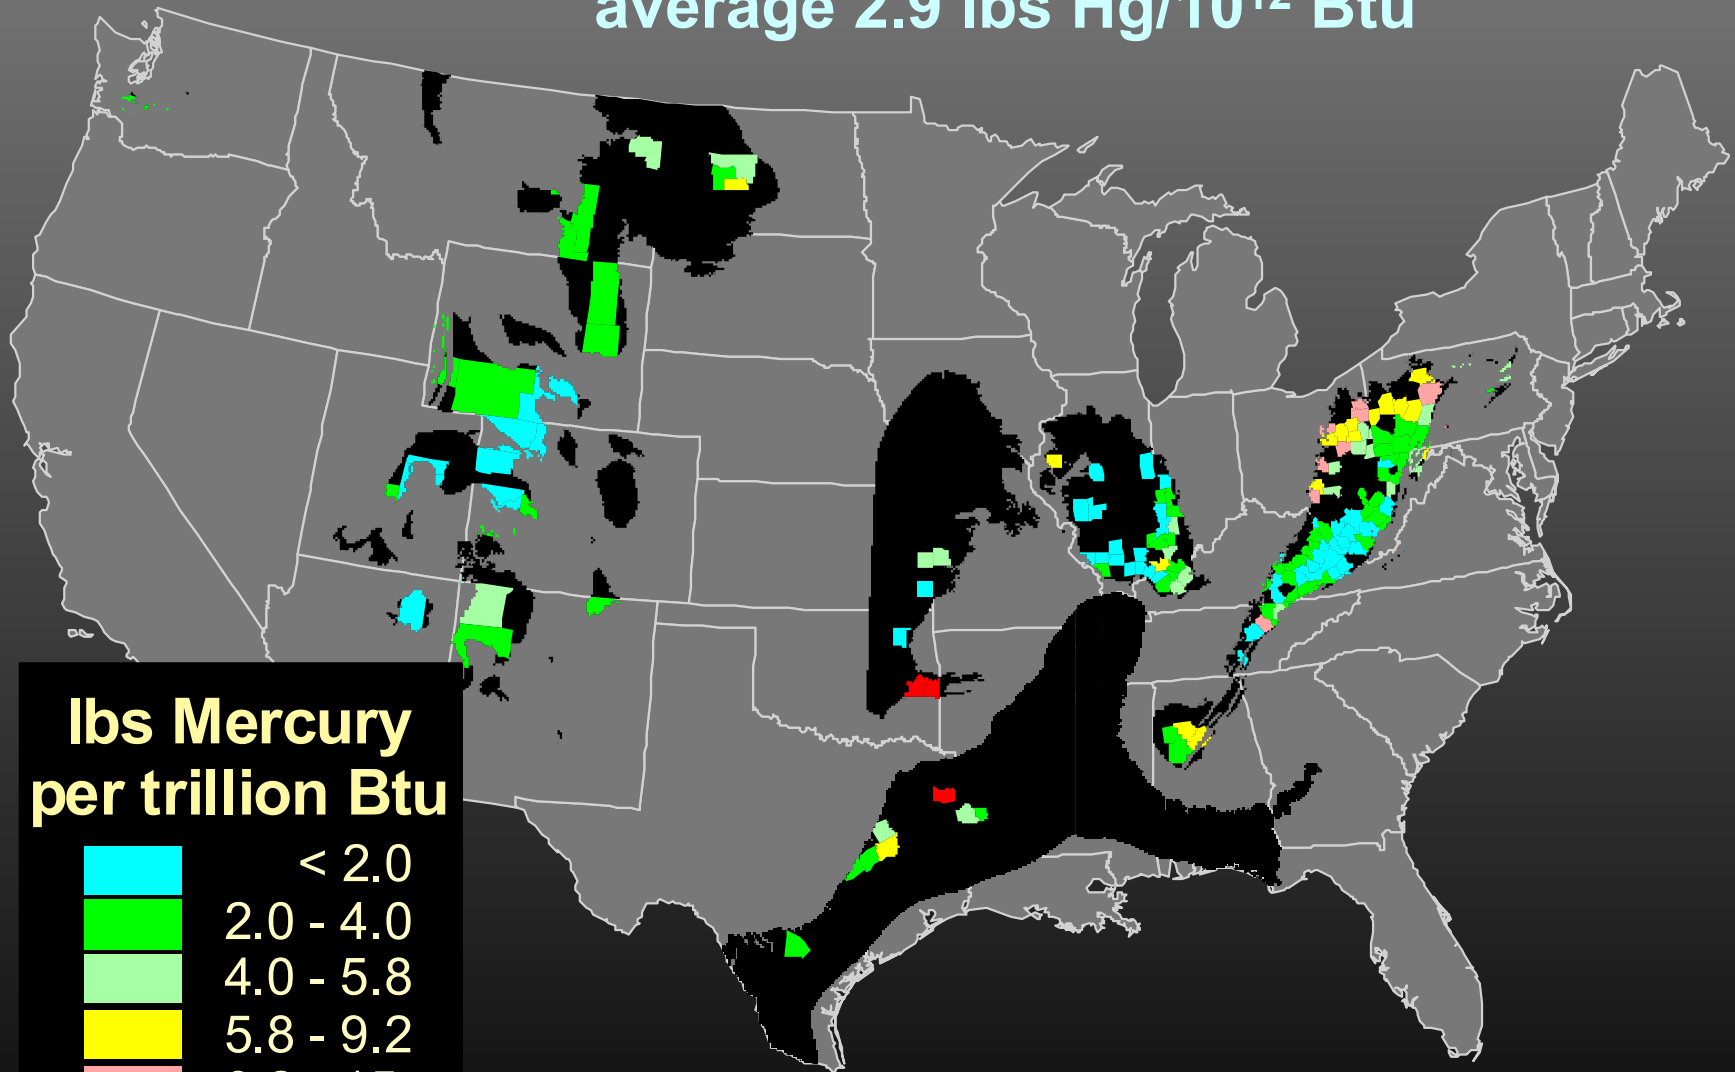

**lbs Mercury  
per trillion Btu**

# cold ESP/FGD Hg emissions, by coal origin

average 2.9 lbs Hg/10<sup>12</sup> Btu

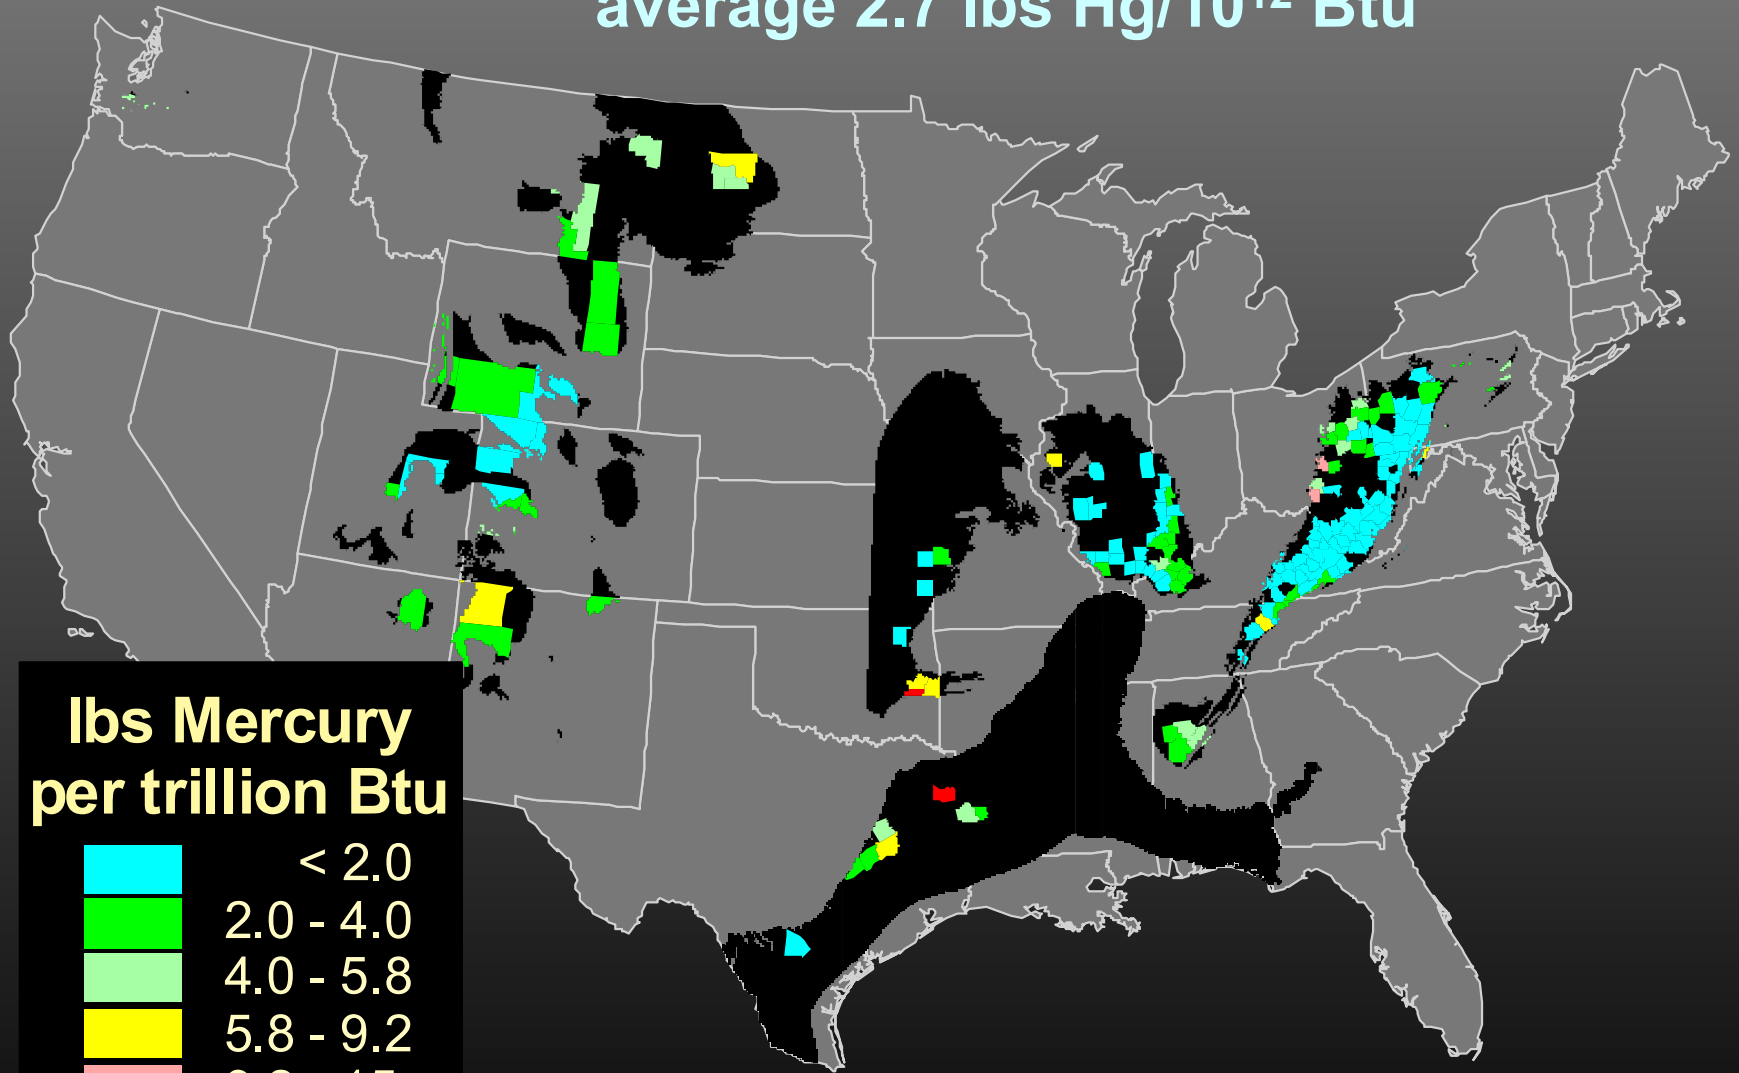

**lbs Mercury  
per trillion Btu**

# SDA/FF Hg emissions, by coal origin

average 2.7 lbs Hg/10<sup>12</sup> Btu

**lbs Mercury  
per trillion Btu**

# Implications

## Coal Washing

**Useful where produced coal has similar or greater mercury levels than the in-ground coal**

## Coal Selection

**Low mercury coal for hESP, cESP, hESP/FGD**

**High chlorine coal for cESP/FGD, SDA/FF**

## Coal Blending

**For ESP/FGD and SDA/FF units, blend to between 500 and 1000 ppm Cl (e.g., PRB and deep IL basin)**

## Coal Sulfur

**Low sulfur coal for situations where carbon in fly ash is used to improve mercury capture**
